In computing the said period of three clear days, Sundays and Customs holidays shall not be taken into account, but in ascertaining the period for which any goods are liable to double rent, account shall be taken of Sundays and Customs holidays, and a fractional part of a period of 24 hours shall count as a full period of 24 hours.

(ii.) All goods which are within five days from the date of landing (of which days the day of landing and the day of re-shipment shall each count as one) either (*a*) lodged within the re-shipment warehouse provided by the Government or (*b*) re-shipped shall be free of warehouse rent. If not so re-shipped or lodged within the re-shipment warehouse within five days after landing, rent, from the date of landing, will be charged as on import cargo until date of such re-shipment or removal. Provided that all goods lodged in the re-shipment warehouse shall be liable to a single rate for the first eight days from the date of landing, and after the expiry of the eighth day for every additional seven days or fraction of seven days to an additional rate equal to single rate.

(iii.) The liability to single and double warehouse rent extends to all coastwise goods, whether of foreign origin or of local production and manufacture.

(iii.) (*a*) Provided that rent shall not be recovered for goods carried only on a Coastwise permit between outbays at which no Customs House is stationed and the Ports to which the outbays belong, nor for duty-paid goods shipped on boat notes from Kayts to Jaffna. The Islands adjoining and forming part of the Northern Province are for this purpose outbays of the Ports of Jaffna and Kayts.

(iv.) Chanks are exempted from warehouse rent. Cargoes of coral stones are exempted from double rent.

All goods laden for shipment and not shipped but re-landed will be allowed to remain in the warehouse free of rent for three clear days from the date of re-landing, after which they will become liable to the payment of a daily rent.

METEOROLOGY.

General Remarks.—There is a very marked variation in climate between the different parts of Ceylon. In the low-country, with a mean temperature of the order of 80° F., there is wide divergence between the moist conditions in the south-west of the Island, where the annual rainfall is often over 100 inches, and the dry zone areas of the north, north-west, and south-east.

Inland, with an altitude reaching 8,000 feet, a cooler climate is experienced with a corresponding change in vegetation and an increased daily range of temperature. Considering how small the area of Ceylon is, the "coast and continental" variation is well marked.

The mean temperature for the year 1912 was highest at Mannar 83·2° and lowest at Hakgala 58·4° F.

At Colombo and Kandy the mean temperature was 81·0° and 76·6° respectively.

The mean daily range of temperature, *i.e.*, the mean of the daily differences between the maximum and minimum temperatures, was highest at Badulla, having been 19·0°, and lowest at Galle 9·5°.

The differences recorded at Colombo and Kandy were 13·8° and 15·0° respectively.

The absolute range or differences between the highest and lowest temperatures of the air recorded during the year was greatest at Diyatalawa and lowest at Galle, having been 39·7° and 25·6° respectively.

The absolute range at Kandy was 35·9° and at Colombo 35·3°.

Meteorological Observatories.—Table I. gives the approximate positions of the sixteen principal meteorological stations.

In the cases of Mannar and Hakgala the elevations are only estimated by barometer comparisons.

All these stations are supplied with the following instruments :—Maximum air thermometer, minimum air thermometer, maximum wet bulb thermometer, minimum wet bulb thermometer, terrestrial radiation thermometer, and rain gauge. Solar radiation thermometers *in vacuo* were in use in 1912, but are being withdrawn. The coast stations are supplied with barometers, anemometers, and wind vanes; in addition there is a barometer at Ratnapura, a wind vane and anemometer at Diyatalawa, and there are self-recording barographs, pluviographs, hygrographs, and thermographs at Colombo and Trincomalee, and a thermograph and hygrograph at Diyatalawa.

A Beckley self-recording anemograph is in use on the Surveyor-General's Office at Colombo (Fort).

Besides these stations there are 218 rain-gauge stations, most of which report monthly, though daily telegrams are sent from Chilaw, Kalutara, Hatton, Kegalla, and Watagoda. Including the first class stations there are 235 rain-gauge stations in all, of which 114 have an annual average rainfall of over 75 inches. Details are supplied in Table XXVII. and the rainfall maps at the end of the report.

Table II. shows the extremes of temperature and pressure recorded in 1912. The highest shade temperatures shown in any of the existing records are 103·7° on May 12, 1890, at Trincomalee, and 103·0° on September 30, 1887, at Anuradhapura. Ratnapura, Mannar, Jaffna, Batticaloa, and Kurunegala all claim to have passed 100° F. at some time or another. In previous reports it has been customary to give the extreme values ever recorded at each station, but an examination of some of the material from which these figures were taken has cast doubt on so many of these "records" that the columns have been deleted.

AIR TEMPERATURE.

Table III. gives the average mean monthly temperature of various stations derived from all available records, *i.e.*, for periods of not more than 44 years. The means adopted are the arithmetical means between the maximum and minimum readings of each successive twenty-four hours.

The table will be found to be in approximate agreement with Table IV. of the 1911 Report, outstanding differences being due to the omission of a number of old statistics which are found to be inaccurate.

Table IV. gives the average daily range for each month and, like Table III., shows several deviations from its immediate predecessors on account of the recent examination of past returns.

Table V. shows the deviations of the 1912 mean temperature from normal. It will be noticed that January was colder than usual at every station and that February was as consistently above normal. Looked at by stations the most noticeable feature is that no station differs from its annual average by as much as a degree. Galle and Ratnapura have the coldest deviations and Batticaloa ties with Mannar for the hottest.

Table VI. gives the detail of temperatures in 1912. The Stevenson screen is not in use in Ceylon; the instruments are exposed in open sheds from 8 to 10 feet square, whose sides are usually enclosed by wire netting. At Galle and Hambantota light wooden trellis replaces the wire netting.

Radiation Thermometers.—Table VII. gives the readings for 1912 of the terrestrial radiation thermometers (minimum on grass). These instruments are very liable to trouble in the form of spirit bubbles separating from the main column; it is also found that their index corrections are less stable than those of the instruments in the sheds.

An average of all past records is not given in this report, as many of the old minimum on grass readings are obviously incorrect.

The solar radiation thermometers have been withdrawn from the end of 1912. For some time I have felt suspicious of these instruments, whose large and variable index corrections made it exceedingly doubtful what they actually did measure.

In withdrawing them I am following the example of the Indian Meteorological Department.

WET-BULB TEMPERATURES.

These are dealt with in Tables VIII. to XI., while the matter of Tables XII. and XIII. is dependant on them. The arrangement being somewhat different to former reports, a word of explanation may not be out of place.

For many purposes it would be well if the wet-bulb thermometer could take the place now held by the ordinary dry-bulb, since its readings are more closely allied to the human sensations than those of the dry instrument. In fact, the human body is itself a "wet-bulb" thermometer of considerable sensitivity though of somewhat uneven graduations, so that there is a very good case for regarding this instrument as the fundamental one, and not merely as an accessory to be used as an "assistant" to the dry-bulb in finding the humidity. Direct determinations of the dew point have led me to doubt the suitability of the Glaisher factors for use in Ceylon. The sharp changes in altitude make it almost certain that a formula involving the barometer must be used, and it is probable that some form of August's or Pernter's formula will be used in next report.

In the meantime, Table XII., though of a type sanctioned by previous usage, must be regarded as *sub judice*. It is retained in this report pending the completion of a series of experiments to determine which formulæ give results most consistent with direct determinations in Ceylon.

Table XIII. replaces the old humidity tables and gives the offsets of 1912 from the previous averages, both calculated on Glaisher's formula. This appears to be quite allowable, as a slight change of absolute value due to a different formula would alter the two quantities about equally and so not alter the offsets appreciably.

The figures in Table XI. will enable anyone who wishes to obtain the humidity on any particular formula to do so.

The arrangement of the wet-bulbs here is the double cup arrangement described in the 1910 Report. As in the case of the dry-bulbs, the Stevenson screen is replaced by an open shed.

TABLE XIV. has been cancelled pending the completion of the dew point experiments.

ATMOSPHERIC PRESSURE.

The standard barometer at Colombo Observatory is No. 594 by Casella, and is of the Fortin type. It was originally standardized at Kew, and has since (1907) been compared by means of a travelling instrument with the Indian standard. The rest of the outstation barometers reported here are of the self-adjusting type described in the 1909 Report, *i.e.*, with wider base cisterns than are usually found in the Kew type of instruments. They have all been standardized by comparison with the Colombo instrument.

Table XV. gives the averages up to date reduced to the present altitudes of the instruments, and Table XVI. gives the offsets of the 1912 figures from these averages. The question of eliminating doubtful work from this table was gone into in detail in the 1911 Report, so need not be referred to at length here.

The averages given in the last report seem fairly well confirmed by this year's working. Batticaloa is the most suspicious, the accepted average being possibly a trifle too high—which is supported by the fact that there have been some large, positive, index corrections at that station in the past, some of which may have been in excess. At Hambantota a determination of the level has given 64 feet above mean sea level in place of the previous "50 feet approximately." This does not affect these tables, but would introduce a slight increase into the mean sea level equivalent values such as were given graphically in the last report.

All the figures given in the next three tables are corrected for temperature, but not for altitude. To obtain mean sea level equivalents add 0·001″ for each foot of altitude of the stations which were given in Table I. [This correction only applies to the coast stations, and cannot be used for the higher inland stations.]

WIND.

Wind Direction.—Observations are taken at the coast stations at 9.30 A.M. and 3.30 P.M. Table XVIII. gives the number of times that each of eight directions and calms were noted, parallel columns giving figures for 1912, and for averages up to 1912 inclusive. A mean direction giving the trigonometrical resultant of these figures is computed for those months that justify such a course; for this purpose directions are given in angle N = 0°, E = 90°, S = 180°, and W = 270°, and computations are to the nearest 5°.

In many months the distribution is irregular, and an attempt to express the resultant by a single angle would be misleading, so has been relinquished; *e.g.*, suppose the wind blows from the N.E. for 25 observations, from N.W. for 10, and from S.W. for 25, mathematically the N.E. and S.W. constituents cancel and we are left with a mean direction of N.W. for the month, although for five-sixth's of the month the wind was at right angles to this (*e.g.*, November, Puttalam, is a good example).

The Colombo figures are from the Observatory, not the Fort.

Wind Velocities.—Table XIX. gives the numerical value of the daily movement in miles both for the current year and for the available average.

The readings are from instruments of the Robinson type. In some cases it has been found necessary to cancel a good many of the old statistics, one notable reason being the effect of change of site on the records. Thus, taking the case of Trincomalee it would be misleading to compare the present observations on the top of Fort Frederick with averages largely derived from readings taken in the Public Works Department yard close to sea level.

As in the case of the cloud observations, an examination of the offset of any month from the annual average is not seriously affected by the chief difficulties that militate against the accuracy of the absolute readings.

A Beckley self-recording instrument is in use at Colombo (Fort), and two self-recording instruments are in use at Colombo Observatory, the details of which are given as an Appendix to the Superintendent's report. The values given in the Table XX. are derived from the former.

CLOUD PROPORTION.

Table XXI. gives statistics on this point obtained by observations at 9.30 A.M. and 3.30 P.M.

The figure 10 denotes an absolutely cloudy sky and 0 an absolutely clear one. Intermediate figures are arrived at by estimating the proportion of the sky covered by cloud, for which purpose the area within 10° of the horizon is neglected.

Absolute values based on such estimation are bound to be affected by the personality of the observer, so that a slight caution is necessary in interpreting them.

Most of the danger is eliminated by showing the cloud proportion of each month as an offset from the mean whether in excess or deficit. Returns from an observer who consistently over-estimates the amount of cloud would not introduce an appreciable error into such a graph, since each over-estimated month is compared with an equally over-estimated mean.

‡ Includes prisoners sentenced to death.

RETURN OF PRISONS AND PRISONERS.

Replies to the Questions, compiled from the Returns of the respective Superintendents.

QUESTION I.

If the prison is on the separate system, is the separation complete ? And if not, what is the separation enforced by day and night, respectively ?

All the penal stage prisoners of the Island, if sentenced to over a month, are passed through one of the following jails :—Welikada, Kandy, Jaffna, Anuradhapura, Ratnapura, Galle, and Batticaloa.

In these jails the penal stage prisoners are worked on the separate system. They are confined in separate cells, and are worked in stalls. They are marched from their cells to the stalls in single file three paces apart, and are not allowed to speak or communicate with each other at all. Prisoners not in penal stage are not worked on the separate system.

QUESTION II.

If not on the separate system, what provision is there for the supervision of the prisoners while in association ?

The males are supervised by male officers of various grades, and the females by matrons, in all jails.

QUESTIONS III. AND IV.

How many cells are there ; and how many associated wards ? Taking the *average* number of prisoners in jail, how many cubic feet of space are there for each prisoner during the hours of sleep ?

QUESTION VI.

Is penal labour—that is, labour by treadmill, crank, or shot-drill—in force ?

The penal labour consists of beating coir husk, and metal-breaking. Treadmill work is carried on in Welikada.

QUESTION VII.

This penal labour is enforced during the penal stage, and also in the cases of prisoners reduced to the penal stage as a punishment. Total time at treadwheel labour is 8 hours and 15 minutes. Length of spells 15 minutes, and interval of rest 5 minutes.

QUESTION VIII.

What kind of labour, other than penal labour, is in use ?

At *Jaffna*, on reclamation work.

At *Mankulam*, in metal-breaking and quarrying for the Irrigation Department.

---

(2) How are they supervised ?

By Superintendent, Assistant Superintendents, Jailers, Deputy Jailers, Overseers, Sub-Overseers, and Guards.

---

(3) How many escapes of prisoners, while being employed beyond the jail, have taken place during each of the last three years ?

2 in 1910, 10 in 1911, and 6 in 1912.
